AI Chat Log Summary

Deliverable 03 | 4 November 2026

This is a brief summary of how I used ChatGPT to support my Python assignment, Git workflow, and submission preparation. It is not a verbatim transcript of the conversation.

1. Python and object-oriented programming

I asked for some help with Task 1 involving the **Character** class. ChatGPT helped me understand how **take_damage()**, **heal()**, **attack()**, and the **is_alive** property should work. I also asked about following PEP 8 style conventions.

2. Git and collaboration

I received guidance on creating and switching branches, making commits, pushing to **g_branch**, and opening a pull request against **main**. ChatGPT explained push errors, a merge that could not finish because the **vi** editor was missing, and the difference between local and remote branches.

3. Synchronization and file conflicts

I asked how to get my classmate's latest code from **main** without losing three new files I wanted to keep. ChatGPT explained divergent branches and warned that **git reset --hard** can discard local work. It also explained how to keep the version saved on disk when VS Code reported a save conflict.

4. Submission documentation

ChatGPT provided commands for exporting **main.ipynb** to a PDF, generating **requirements.txt** with pip freeze, and saving Git history to **git_log.txt**.

How AI was used

I used ChatGPT for explanations, code examples, and troubleshooting. I ran the Git commands myself and shared screenshots when asking for help. The conversation does not establish that every code suggestion was tested or that every proposed command was executed.
